1. OPERATIONS 1 - 31 DECEMBER):

a. Mission

- (1) 1 -19 December: Direct support of the 12th Engineer Combat Battalion of the 8th Infantry Division.
- (2) 20-31 December: Normal Corps Engineer Assignment.
- (3) Synopsis:

At the beginning of the month the battalion continued its direct support of the 12th Engineer Combat Battalion of the 8th Infantry Division. The 8th pushed to the ROER River in the HURTGEN-BERGSTEIN sector, and the battalion supported the Division Engineers by maintaining supply routes forward to a line established by the Commanding Officer, 12th Engineers, as his own rear boundary. Work forward of this line was executed at the request of the Division Engineer, which included mine clearance, repair and maintenance along roads, removal of disabled armored vehicles from roads, the placing of mines as road blocks, and the laying of anti-personnel mines. During the operation close liaison was maintained with the 12th Engineer Combat Battalion through the Assistant Division Engineer, who lived at the Division Engineer Headquarters.

On 20 December the battalion moved south to the VERVIERS-MALMEDY area as V Corps shifted its boundaries to meet the German break-through in this sector. Here the battalion was assigned an area for road maintenance in rear of the 30th Division and, later, in support of the 1st Division.

The importance of keeping roads open in this sector was impressed upon all officers and men in statements from the Group Commander and the Corps Engineer. These

statements pointed out that the shifting of troops and the flow of supplies must not be interrupted by breakdown in the road net. Accordingly, all assigned roads were patrolled continuously by parties in 1/4 ton trucks, so as to discover and remove, in a minimum of time, any roadblock which might appear. These patrols maintained contact with the wrecker stations by radio SCR-300; these stations were placed at two stratigical points along the main supply route. Each station was composed of one working squad of men, one 4-ton wrecker, one R-4 dozer and one 2½ ton truck.

The roads in this sector, aided by the freezing weather, proved to be in excellent condition. Work here was concentrated on the repair and maintenance of a four thousand yard stretch of the EUPEN-MALMEDY Road, and upon spreading cinders on the icy roads. All dump trucks of the battalion were employed daily in the stockpiling of crushed rock and cinders.

Other assignments included the reconnaissance for location of minefields and road blocks, to conform to the V Corps Barrier Plan, and the estimate of time, men and materials required to execute these barriers. Preliminary work was done on several roadblocks, and an extensive minefield, employing both American and British anti-personnel mines, was laid and maintained.

b. Other Events

- (1) Church services, Protestant and Catholic, were held during the month. Special masses and services were held Christmas, by the Group Chaplains, in the church at SART and in the mess hall of Headquarters and Service Company.
- (2) During the last ten days of the month, for the first time since landing on the continent, the battalion was billeted in buildings near SART, Belgium. The Headquarters and Service Company was housed in a large inn. Its spacious dining hall, besides being used as such, provided a place for church services, movies, and recreation events for the battalion.
- (3) Nearby, in a garage, the water supply section erected its improvised showers for the convenience of nearby units as well as the men of the 1340th Engineers.
- (4) A distinct feeling of thankfulness and gratitude prevailed throughout the entire battalion on its third successive Christmas Day overseas. Turkey was plentiful.

2. LOCATION:

HEADQUARTERS 1340TH ENGINEER COMBAT BATTALION
Office of the Battalion Commander

BAR/wop
APO 230, U.S. Army,
26 December 1944.

SUBJECT: Battle Experiences.

TO : The Commanding Officer,
1191st Engineer Combat Group,
APO 230, U.S. Army.

In compliance with letter, your headquarters, dated 16 December 1944, subject as above, the following is submitted.

1. The attached sketch indicates how conditions of a site at a destroyed bridge near Florenville, Belgium, forced us to construct a Bailey Bridge in a rather unique manner.

2. The span, 110 feet, was located on a long gradual curve with approach roads approximately 15 feet higher than the adjacent fields. This greatly restricted the launching area and meant that after the bridge was launched it missed the far shore rollers by approximately 18 feet. The bridge was kept balanced in this off-center position by using 8 s/s bays in the launching nose against 8 t/s bays on the near shore, three forward of the rollers and five in the rear. The near shore plain rollers were removed and replaced with a cribbing of chess which was greased to permit the panels to slide sideways. The entire bridge was then pivoted on its construction rollers by using winch cables, from two 2 1/2 ton trucks, hooked on to the rear panels of the bridge. The bridge swung perfectly into position one foot above the far shore rollers where it was let down and pushed forward.

3. The remainder of the bridge was then constructed in the normal manner.

For the Commanding Officer;

OLIVER I. TUTHILL,
1st Lt., C.E.,
Adjutant.
